

# Installation and User guide for One Page Checkout module for Prestashop™ 1.4

## Installation of One Page Checkout (OPC) module

- 1/ Unpack and copy directory `onepagecheckout` under `modules` directory in Prestashop root.
- 2/ Copy files from `modules/onepagecheckout/modified_1.4/override` to your Prestashop `override` directory
- 3/ Install module in Prestashop backoffice, under Modules tab, section "Other modules"

(!) In case you already have overridden these files in `override` directory, you need to merge changes manually with overrides from OPC module.

(!) This version of OPC module is suitable only for Prestashop 1.4.0 and newer, please don't install it on older versions.

## Update from previous version

To update OPC module, uninstall previous version (from Backoffice / Modules) and install new version by following Installation instructions above.

## Third party modules support

### ship2pay module (payment selection based on selected carrier)

Ship2pay is module for matching certain payment options with carrier selected. To easy things up, ship2pay module is included with OPC module, under `extras` directory.

To enable it, please copy `extras/modules/ship2pay` to `modules` directory and install ship2pay module from Backoffice.

Then go to OPC module configuration and turn on "Ship2pay module support".

(!) If you had ship2pay module before, please uninstall it first including all overrides. All necessary overrides are already included in OPC module and thus they are not necessary anymore.

## Translations

OPC module reuses as much as possible of existing translations so that translation of checkout page is as easy as possible. To achieve this, existing translations from your Prestashop installation are copied to module directory so you can edit them easily in Backoffice / Modules / Other Modules - choose One page checkout and at the top of the page click desired language flag.

Moreover, OPC module comes with several languages so that translating is not necessary at all -

Contact & Support: [prestamodules@gmail.com](mailto:prestamodules@gmail.com)

amongst them - French, Spanish, Dutch, German, Finnish, Swedish, Romanian, Polish, Russian, Czech, Slovak.

In case you need to install new language later and OPC module is installed already, please use "Reset" module so that language packs are reinstalled.

Credits for translations belong to:

Swedish - Mikael Ström  
Russian - Ekaterina Kukushkina  
Romanian - Dimofte Catalin  
German - Henrik Pantle  
Spanish - Alejandro E. Lozano Enriquez  
Dutch - Bjorn van den Brule  
Danish - Martin Hansen

Slovak, Czech, Polish, Finnish, French - other translations provided by myself or anonymous contributors

## Troubleshooting

General troubleshooting tips:

1/ Have a look in Javascript error console (e.g. in Firefox: Tools -> Error console)

2/ Turn on debugging in config/config.inc.php, line 29:

```
@ini_set('display_errors', 'on');
```

3/ Clear your browser cookies and cache./

4/ Clear smarty cache (delete content of folder `tools/smarty/compile`)

### ***After installation, there's still original checkout***

Please make sure you have copied files from `modified_1.4` folder to correct place in `override` directory in Prestashop root and that smarty cache was cleared.

### ***Checkout page (center column) is empty, in Error console I can see - Error: guestCheckoutEnabled is not defined***

Go to Backoffice / Preferences / Performance and in Combine, Compress, Cache section turn off "Compress inline JavaScript in HTML".

### ***Certain payment method does not show up in payment methods list***

Payment module templates are parsed by OPC module so that they can be displayed as radio buttons. I suggest to contact me with more details about that payment module and for the time being, turn off in OPC configuration page "Payment options as radio buttons".

### ***Moneybookers payment options are not displayed in payment methods list***

Please make sure that "Display mode" at the bottom of Moneybookers configuration page is set to "1 block for each logo".

***Something's not right in IE8 - margins are big, scroll cart doesn't work properly or opacity effect isn't correct on scroll summary section***

Most probably this is caused by IE8 rendering mode, please set "IE8 Standards" rendering mode in your template by editing themes/YOUR\_THEME/header.tpl, add this to your meta tags (e.g. below <meta name="robots" ....>

```
<meta http-equiv="X-UA-Compatible" content="IE=8" />
```

Restart IE browser so the new settings are picked up from server and try again.
